

Design candidates for stronger iterative evolution

PROPOSED · not implemented or evaluated

A Preserve the target decision

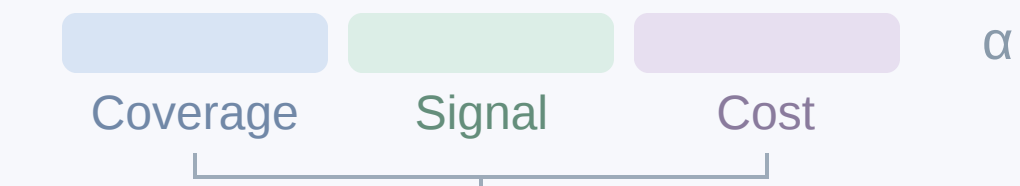

Priority 1 · strengthen workload calibration

Keep required information and real actions.
Test: mechanism retention + held-out transfer

B Allocate useful coverage

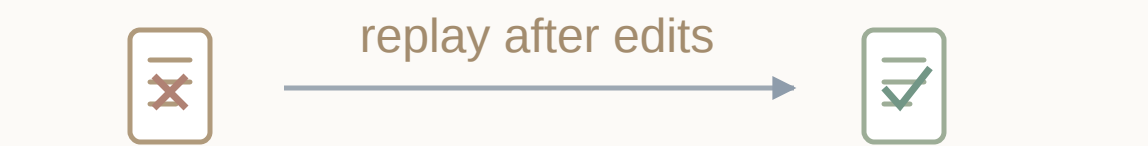

Priority 2 · strengthen portfolio-level signal

Probe by mechanism and task variant.
Test: useful groups + transfer per total cost

C Retain counterexamples

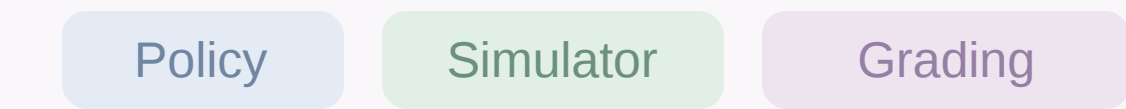

Support · make semantic repairs persistent

Replay known defects; keep diagnostics off-train.
Test: recurrence of previously confirmed defects

D Audit the source of variation

Support · distinguish policy signal from noise

Hold task state fixed; check grading consistency.
Test: stable task signal and diagnostic overhead

A/B change the adaptation strategy. C/D make its feedback more trustworthy.
